

1. PROJECT OVERVIEW

- **Project Title:** ComicCraft - AI Comic Story Creator using Gemini Models

2. INTRODUCTION TO TEAM COMMUNICATION Effective communication and seamless collaboration are vital for the successful execution of an AI-driven software project like ComicCraft. Given the technical complexity of integrating multiple asynchronous APIs (Google Gemini and Hugging Face Stable Diffusion) with a FastAPI backend, the team established a structured communication framework to track progress, resolve coding blocks, and manage documentation.

3. COMMUNICATION CHANNELS AND TOOLS

- **Instant Messaging & Daily Standups (WhatsApp / Discord):** Used for real-time updates, quick bug fixes, sharing terminal logs, and discussing API error workarounds (such as the long-path registry fix and dual-engine fallback logic).
- **Version Control & Code Review (GitHub):** The primary repository (Vetri-Thiran / ComicCraft) served as the central collaboration hub. Pull requests, commit messages, and branch updates ensured code synchronization among all members.
- **Virtual Meetings (Google Meet / Zoom):** Conducted bi-weekly sprint reviews to evaluate progress, review generated UI mockups, and coordinate the recording of the project demo video.
- **Cloud Document Sharing (Google Drive / Docs):** Utilized for drafting structural reports, compiling screenshots, and finalizing the SmartInternz submission folder structure.

4. COLLABORATIVE WORKFLOW

- **Task Delegation:** Responsibilities were divided based on individual strengths—frontend styling, backend FastAPI routing, AI prompt engineering, and report compilation.

- **Issue Tracking:** When facing external network blocks (such as DNS error 11001 or API 402 limits), team members communicated logs instantly to test and deploy backup solutions collaboratively.
