

1. PROJECT OVERVIEW

- **Project Title:** ComicCraft - AI Comic Story Creator using Gemini Models

2. INTRODUCTION The demonstration of proposed features provides a comprehensive walkthrough of ComicCraft's capabilities, showcasing how the application successfully transforms simple text prompts into fully formatted, downloadable comic books.

3. CORE FEATURES DEMONSTRATED

- **Feature 1: User Input & Parameter Selection**
 - *Demonstration:* Shown in Screenshot 1 (Home Page). The user navigates to <http://127.0.0.1:8000>, enters a creative prompt (e.g., "A funny day in the park"), specifies character names, settings, tones, and selects an art style from dropdown options.
- **Feature 2: Multi-Model AI Generation Pipeline**
 - *Demonstration:* The backend processes the form using Google Gemini Flash for JSON structural outlines and Gemini Pro for rich narrative dialogue, instantly coordinating with Hugging Face Stable Diffusion to render panel illustrations.
- **Feature 3: Dynamic Web Preview Rendering**
 - *Demonstration:* Shown in Screenshots 2 and 3 (Loaded / Comic Preview). The user is redirected to an interactive page where generated panels appear sequentially, displaying panel titles, vibrant illustrations, and clean narration text.
- **Feature 4: Automated PDF Export**
 - *Demonstration:* Shown in Screenshot 4 (Download PDF). The user clicks the download button, triggering the FPDF backend compiler to package the entire comic into a professional, downloadable multi-page PDF document.
- **Feature 5: Robust Error Recovery & Fallbacks**

- *Demonstration:* The demo video highlights the application's resilience—if an external API hits rate limits, the system instantly switches engines or falls back to a professional Python PIL-rendered comic caption panel, ensuring zero downtime.
