

1. PROJECT OVERVIEW

- **Project Title:** ComicCraft - AI Comic Story Creator using Gemini Models

2. INTRODUCTION While ComicCraft currently operates as a highly efficient local web application powered by FastAPI and Uvicorn, its architecture is engineered with scalability in mind. The future roadmap outlines how the platform can evolve from a prototype into a production-grade commercial web service.

3. SCALABILITY ROADMAP

- **Cloud Deployment & Containerization:**
 - Transitioning from local localhost hosting to cloud platforms such as AWS, Render, or Hugging Face Spaces using Docker containers for seamless global accessibility.
- **Database Integration (SQLAlchemy & SQLite/PostgreSQL):**
 - Implementing persistent user accounts, authentication (Login/Signup), and saving historical comic generation logs so users can revisit and re-download past creations.
- **Advanced Multi-Page Generation:**
 - Expanding the core engine from a 5-panel layout to a full 20+ page graphic novel generation capability with multi-chapter story continuity.
- **Community Marketplace & Sharing:**
 - Adding social sharing buttons and a public community gallery where users can publish, rate, and remix comics created by others.
- **Fine-Tuned Custom Models:**
 - Integrating custom-trained Stable Diffusion LoRA models specifically optimized for consistent character faces across multiple comic panels.
